

Make Automation — Best Invest Properties

Date: 26 September 2026

Automation service: Make

Main system: Bubble

1. What Make does

Make is the automation service that connects the platform to outside services: property portals and OpenAI. The platform itself (Bubble) stays the single place where all data is stored and all figures are calculated, and it also sends all emails.

The division of responsibility is simple:

System	Role
Make	collects rental data from portals and requests the AI text
Bubble	stores the data, calculates every figure — price, rent, yield, score — and sends all emails
OpenAI	writes the text explanation of an already verified result

Make **does not**:

- store business data;
- calculate yield, tax or score;
- publish or change anything on the site without Bubble checking it first;
- make any approval, legal or investment decision.

2. How an automation works

Every automation follows the same five steps:

1. Something happens on the platform — for example, a property's score is calculated, or a rent sample becomes older than 90 days.
2. Bubble records a task: what needs to be done and for whom.
3. Make picks up the task and does the external part: asks OpenAI or collects listings from a portal.
4. Make reports the result back to Bubble.
5. Bubble applies the result and marks the task as done.

Each task has a unique key, so **nothing is ever done twice**: if a step is repeated after a network error, the analysis is not generated again and the listings are not stored twice.

3. Automations in the MVP

The MVP needs **two** Make automations.

#	Automation	When it runs	What it does
1	Rental data collection	on a schedule	collects comparable rental listings from approved portals
2	AI investment analysis	when a property's score is calculated	asks OpenAI to write the analysis text

Done by the platform itself (Bubble), without Make:

- **all emails**, including introductions and price/availability alerts;
- **the saved-search digest** (daily or weekly);
- **score recalculation** — with progress shown on the Score Editor screen;
- **failure tracking** — failed tasks appear on the Automation Monitor screen.

Not built in the MVP: **CRM export**.

4. Automations in detail

4.1 Rental data collection

This is the main reason Make is part of the platform. The market rent estimate comes from real comparable listings, not from the developer and not from AI.

How it works:

1. On a schedule, Make asks Bubble which rent samples need refreshing — samples that are missing or older than **90 days**.
2. Make collects comparable rental listings from each approved portal through its official API or data feed.
3. The listings are grouped by country, city/district, property type, number of bedrooms and floor area.
4. Make calculates the number of listings, the rent range and the median.
5. The result arrives in Bubble as a new sample with the status "**awaiting review**".

Rules:

- Make **never** changes a published figure. The admin reviews every sample before it can be used.
- A sample of fewer than **5** listings is saved but cannot be approved.
- A sample of **5-9** listings can be approved but is marked "**thin sample**", and investors see this note.
- A new sample never overwrites the previous one.
- If a portal has no API or feed, the admin can enter or import the listings manually — they are stored the same way.
- If a portal stops responding several times in a row, the team is notified, so the rent estimate never goes out of date unnoticed.
- Each portal is connected only after its data terms of use have been checked.

The thresholds (5, 10 and 90 days) are country settings and can be changed without development work.

4.2 AI investment analysis

When a property's score is calculated, Make sends OpenAI the verified facts about the property — never any investor data — and receives the analysis text.

- The text is saved as **"awaiting review"** and appears on the site only after the admin approves it.
- If the text contains a number that is not in the facts, contradicts the score or promises returns, it is rejected automatically.
- If OpenAI is unavailable, the property page still shows the score breakdown and the financial table, with the note "Narrative analysis is being reviewed".

4.3 Emails (sent by Bubble)

All platform emails are sent by Bubble, from the platform's own email domain. Every email is logged; if one fails, the decision is not cancelled — the admin sees the failed email on the Automation Monitor screen and can resend it with one click.

Event	Who receives the email
Registration / password reset	the user
Developer application received	the developer
Verification decision: more information needed / approved / rejected	the developer
Project decision: changes requested / approved / published / rejected	the developer
Price or availability change: queried / approved / rejected	the developer
Enquiry received	the investor
Introduction approved ("Approve & connect")	the investor and the developer — each with the other's approved contact details
Enquiry put on hold	nobody
Enquiry declined	the investor only — a neutral "not available" message with three similar properties, no reason
Price or availability of a saved property changed	investors who saved the property or have an open enquiry about it

Rules:

- On a decline, the reason is never included in any email.
- The developer receives no email about a decline; they only see a count of filtered-out requests in their portal.
- For an introduction, if one of the two emails fails, only that email is resent — the other party never receives a duplicate.
- Marketing emails are sent only to users who have given marketing consent. Security and service emails are always sent.

4.4 Saved-search digest (sent by Bubble)

Once a day or once a week (as the investor chooses), Bubble finds new properties matching each investor's saved searches and sends one digest email per investor. Investors who have switched alerts off receive nothing.

5. When something fails

- Temporary errors (network, a busy service) are retried automatically.
- A task that still fails — a Make automation or an email — appears on the **Automation Monitor** screen in the admin area with a **Retry** button; for Make failures the team also receives an email.
- A repeated task never sends a second email or creates a second analysis.
- A failed email never cancels or changes a decision already made on the platform.
